Homework #2

Name : Yi Zhao

Question 1.1 Answer :

$$\frac{\partial l}{\partial \mathbf{u}} = \frac{\partial l}{\partial \mathbf{a}} \frac{\partial \mathbf{a}}{\partial \mathbf{h}} \frac{\partial \mathbf{h}}{\partial \mathbf{u}}$$
$$\frac{\partial l}{\partial \mathbf{u}} = \mathbf{W}^{(2)\top} \cdot \frac{\partial l}{\partial \mathbf{a}} \cdot *H(\mathbf{u})$$

$$l = - \sum_k y_k \log \frac{e^{a_k}}{\sum_{k'} e^{a_{k'}}}$$
$$so, l = - \sum_k y_k a_k + \log \sum_{k'} e^{a_{k'}}$$
$$\frac{\partial l}{\partial \mathbf{a}} = \mathbf{z} - \mathbf{y}$$

$$\frac{\partial l}{\partial \mathbf{W}^{(1)}} = \frac{\partial l}{\partial \mathbf{u}} \cdot \mathbf{x}^\top$$

$$\frac{\partial l}{\partial \mathbf{b}^{(1)}} = \frac{\partial l}{\partial \mathbf{u}}$$

$$\frac{\partial l}{\partial \mathbf{W}^{(2)}} = \frac{\partial l}{\partial \mathbf{a}} \cdot \mathbf{h}^\top$$

Question 1.2 Answer :

Because the gradients of $\mathbf{W}^{(1)}, \mathbf{W}^{(2)}, \mathbf{b}^{(1)}$ are all zero matrices or vectors, in every iterations, when update the parameters, there is no change for $\mathbf{W}^{(1)}, \mathbf{W}^{(2)}, \mathbf{b}^{(1)}$.

Question 1.3 Answer :

$$\begin{aligned}\mathbf{a} &= \mathbf{W}^{(2)}[\mathbf{W}^{(1)}\mathbf{x} + \mathbf{b}^{(1)}] + \mathbf{b}^{(2)} \\ \mathbf{a} &= \mathbf{W}^{(2)}\mathbf{W}^{(1)}\mathbf{x} + \mathbf{W}^{(2)}\mathbf{b}^{(1)} + \mathbf{b}^{(2)} \\ So, \mathbf{U} &= \mathbf{W}^{(2)}\mathbf{W}^{(1)} \\ \mathbf{v} &= \mathbf{W}^{(2)}\mathbf{b}^{(1)} + \mathbf{b}^{(2)}\end{aligned}$$

Question 2.1 Answer :

$$\begin{aligned}J(\mathbf{w}) &= \sum_n l(\mathbf{w}^T \phi(\mathbf{x}_n), y_n) + \frac{\lambda}{2} \|\mathbf{w}\|_2^2 \\ \frac{\partial J(\mathbf{w})}{\partial \mathbf{w}} &= \sum_n \frac{\partial l(\mathbf{w}^T \phi(\mathbf{x}_n), y_n)}{\partial (\mathbf{w}^T \phi(\mathbf{x}_n))} \phi(\mathbf{x}_n) + \lambda \mathbf{w} \\ if, \quad \frac{\partial J(\mathbf{w})}{\partial \mathbf{w}} &= 0 \\ \mathbf{w}^* &= -\frac{1}{\lambda} \sum_n \frac{\partial l(s_n, y_n)}{\partial s_n} \phi(\mathbf{x}_n), \text{ where } s_n = \mathbf{w}^T \phi(\mathbf{x}_n)\end{aligned}$$

so, the optimal solution of \mathbf{w} can be represented as a linear combination of $\phi(\mathbf{x})$.

Question 2.2 Answer :

$$\min_w \sum_{j=1}^N l(\sum_{i=1}^N \alpha_i K_{ij}, y_j) + \frac{\lambda}{2} \sum_{i=1}^N \sum_{j=1}^N \alpha_i K_{ij} \alpha_j$$
